Title: Solubility of additive sextic forms over ramified quadratic extensions of \mathbb{Q}_2

Author(s): Michael P. Knapp

In this article, we study the equation $a_1x_1^6 + a_2x_2^6 + \cdots + a_sx_s^6 = 0$ over the six ramified quadratic extensions of the *p*-adic field \mathbb{Q}_2 . For all of these extensions, we show that if $s \geq 9$, then this equation has a nontrivial solution regardless of the values of the coefficients. For four of the extensions, we show that 9 is the smallest number of variables that guarantees that the equation will have a nontrivial solution.
